## **ABSTRACT**

In this paper, rigorous Mode-Matching Technique (MMT) with Generalized Scattering Matrix Method (GSMM) is used to analyze novel hybrid SIW coupler operating at 26 GHz for 5G applications. The introduced coupler has an equal-amplitude of about -3 dB besides 90-degree at its forward and coupled output ports with more than 4 GHz bandwidth. In addition to rigorous analysis, full-wave CST simulator is used to optimize coupler structure and the results from MMT and CST are compared and discussed. The coupler structure divided into two symmetrical cascaded parts with each part having multi-port bifurcated sections. Due to symmetrical structure, analyzing one half of the coupler with MMT has been sufficient for full analysis.

*Keywords: SIW; mode-matching; coupler; generalized scattering matrix method.*

# **1 INTRODUCTION**

Directional couplers are passive four-port microwave components [1], which are widely used in many microwave and millimeter-wave systems for splitting or combining power with certain ratios and under specific requirements

such as frequencies, bandwidth, and structure dimensions [2, 3, 4, 5]. Directional couplers with equal power and 90° phase-shift output ports are called 90° hybrid couplers [1]. 90° Hybrid couplers can be used in various antenna-feeding networks, radar, power measurements, mixers and other microwave devices [2].

*\*Corresponding author: Email: gcinar@ogu.edu.tr*

Couplers have been incorporated in many microwave systems and applications as mentioned above, therefore, a lot of effort has been put into developing different types, sizes and structures of directional couplers to be used in different applications [6]. Directional couplers can be implemented with many technologies including rectangular waveguides (RCW) and microstrip lines depending on the application needs and structure size. In general, traditional rectangular waveguide couplers have better features than planar couplers regarding to their low insertion losses, high quality factors and power handling. On the other hand, RCW's are difficult to manufacture and they are not easy to integrate into planar microwave systems [7].

For broadband high frequency applications, dimensions of the rectangular waveguide become too small and difficult to implement even with advanced fabrication techniques, therefore,Substrate Integra-ted Waveguide (SIW) technology has been introduced as a suitable way to implement structures such as in [2, 8, 7, 9, 14, 10, 11, 12]. SIW structures have common advantages with printed circuits such as low cost, small size and planar integration. Moreover, SIW technology shares with rectangular waveguides (RCW) most of its properties like low losses and high Q-factors as it is covered by metal surfaces on both sides of the substrate with metal vias integrated within it to work as vertical walls [13].

In the last decade, SIW couplers are preferred more often in high frequency applications because of their above-mentioned properties. In [14], a wideband 90° hybrid SIW coupler having a wide operating bandwidth with obtained fractional bandwidth (FBW) of about 28.5% at 33.5 GHz is presented. Since this coupler operates in the millimeter-wave range and it is a multi-hole type of a coupler, using SIW technique allows its fabrication to be much easier compared to other techniques. Although the compact size, broadband SIW cruciform coupler design (cruciform couplers are usually described as 90° hybrid couplers [15]) introduced in [6] operates in the same frequency range, it has a narrower fractional bandwidth of 18%. While the forward and coupling signals amplitudes must be –3 dB ideally in hybrid couplers, the results in [6] indicate values between -4 dB

and –6 dB due to the losses in the microstrip line feeder. Hybrid SIW coplanar waveguide (CPW) structure coupler is presented in [11] with a fractional bandwidth of about 30% (which is a good result when a planar feeder is used) beside its 90° phase shift between the output ports. The reason of using the grounded coplanar waveguide (GCPW) in the design is to make coupling of the vertical electric fields in SIW with the horizontal electric fields in CPW simpler. Although, results obtained from analyzing SIW coupler structures with commercial full-wave analysis softwares such as CST and HFSS [16] are satisfying, parametric studies and optimization of the designs have large time consumption and they need much memory. Mode Matching Technique, especially with the Generalized Scattering Matrix Method (GSMM) is proven to be very useful and powerful in microwave designs relying upon waveguide structures having discontinuities either physically or geometrically [17]. For example, the paper in [18] considered MMT with GSMM in the analyses of some sectoral waveguide mode converters. In [19], a simple and straightforward MMT approach is presented to analyze SIW coupler with circular vias, which are converted into square shape vias with some restrictions in order to define the structure discontinuities easily. Recently, there have been many other works where MMT with GSMM is applied to several SIW components which introduce fast, exact and robust analyses [20, 21, 19, 22, 23, 24].

This research paper introduces the rigorous MMT procedure to analyze a hybrid SIW coupler operating at 26 GHz for 5G applications. Accurate and fast results are obtained by using MMT, which include the consideration of symmetrical multi-port cascading GSMM. The hybrid coupler is designed to has an equal-amplitude of -3dB besides 90° phase shift at its forward and coupled output ports with more than 4 GHz bandwidth. In cascading analysis for the SIW structure, square vias are assumed as the discontinuities and when connecting the  $2 \times 2$  part to  $3 \times 3$  part, we considered the phase shift in the signal due to the fixed length of the common region. The proposed coupler is also optimized with full-wave solver CST and the results regarding the S-parameters and phase shifts are compared with the ones obtained via MMT.

# **2 DESIGN AND ANALYSIS**

### **2.1 SIW Structure**

SIW structure in Fig. 1. is very similar to a dielectric filled waveguide (DFW) structure as it is

formed of two rows of cylindrical vias (waveguide walls) between metal cover plates, which are separated by a dielectric substrate. So, the  $E$ field distribution in SIW is quite similar to the one in DFW [25].

**Fig. 1. SIW configuration**

The main three SIW design parameters are; SIW width  $w$ , metallic via diameter  $d$  and the pitch  $s$ . In order to avoid any leakage from the structure, these parameters must be calculated using below formulas [7, 25]:

**Fig. 2. SIW 3D coupler structure**

$$
w_{eff} = w - \frac{d^2}{0.95 \times s} \tag{2.1}
$$

$$
d < \frac{\lambda_g}{5}, \quad s \le 2d \tag{2.2}
$$

$$
\lambda_g = \frac{2\pi}{\sqrt{\frac{\varepsilon_r (2\pi f)^2}{c^2} \left(\frac{\pi}{w}\right)}}
$$
\n(2.3)

where, f is the frequency,  $\lambda_q$  is the guided wavelength and  $c$  is the speed of light. In the next subsection, SIW technology will be implemented to design hybrid SIW coupler with  $d = 0.72$  mm and  $s = 1.0015$  mm.

### **2.2 SIW Directional Coupler Design**

Fig.2. shows the designed structure of a 3 dB hybrid SIW coupler with its symmetrical dimensions. RT Duroid 5880 substrate with a

relative permittivity of  $\epsilon_r=2.2$ , tangent loss of  $\tan \delta = 0.0009$  and substrate height of 508 $\mu$ m is used to implement this coupler. Figure also illustrates the coupler parameter values for the frequency range of 23 GHz to 27 GHz. The designed coupler is symmetric around  $x$ -axis and  $z$ -axis, which is the directions of wave propagation. Since the coupler structure is symmetric around  $z$ -axis, analyzing one half of the structure with MMT is enough for full GSMM analysis.

**Table. 1. SIW Coupler Parameters**

| Parameter | mm    |
|-----------|-------|
| $a_1$     | 7.47  |
| $a_2$     | 11.75 |
| $a_3$     | 11.03 |
| $a_4$     | 9.22  |
| $L_1$     | 6.729 |
| $L_2$     | 2.1   |
| $L_3$     | 0.589 |
| LA        | 1.721 |

#### **2.3 Mode-Matching Analysis**

The designed coupler is analyzed rigorously with Mode Matching Technique by considering the first half of it as a single structure and then cascading this half with its mirror image which becomes enough to complete the structure. The geometrical model of the problem is presented in Fig.  $\Lambda$  X denoting the regions I, II, III and IV and  $k_{zm}^{(X)}$  being the wavenumber of the  $m$ -th mode propagating in the relevant region as:

$$
k_{zm}^{(X)} = \begin{cases} \sqrt{\omega^2 \mu \epsilon - \left(\frac{m\pi}{b^{(X)}}\right)^2} & : \text{propagating mode} \\ -\text{i}\sqrt{\left(\frac{m\pi}{b^{(X)}}\right)^2 - \omega^2 \mu \epsilon} & : \text{evanescent mode} \end{cases} \tag{2.4}
$$

the fields in their relevant regions are expressed in terms of normaized modes as

$$
E_y^{(X)} = \sum_{m=1}^{\infty} G_m^{(X)} \sin\left[\frac{m\pi(x + d^{(X)})}{b^{(X)}}\right] \times \left[F_m^{(X)} e^{-jk_{zm}^{(X)} z} + B_m^{(X)} e^{jk_{zm}^{(X)} z}\right]
$$
(2.5)

and

$$
H_x^{(X)} = -\sum_{m=1}^{\infty} G_m^{(X)} Y_m^{(X)} \sin\left[\frac{m\pi (x + d^{(X)})}{b^{(X)}}\right] \times \left[F_m^{(X)} e^{-jk_{zm}^{(X)} z} - B_m^{(X)} e^{jk_{zm}^{(X)} z}\right]
$$
(2.6)

with

$$
Y_m^{(X)} = \frac{k_{zm}^{(X)}}{\omega \mu},
$$
\n(2.7)

$$
G_m^{(X)} = 2\sqrt{\frac{\omega\mu}{b^{(X)}hk_{zm}^{(X)}}},
$$
\n(2.8)

$$
d^{(X)} = \begin{cases} a_0/2 & : X = I \\ a_1/2 & : X = II \\ -a_2/2 & : X = III \\ a_1/2 & : X = IV \end{cases}
$$
 (2.9)

and

$$
b^{(X)} = \begin{cases} a_0 & : X = I \\ a_1 & : X = II \\ (a_1 - a_2)/2 & : X = III \\ (a_1 + a_2)/2 & : X = IV \end{cases}
$$
 (2.10)

These modes are matched at the interfaces of the regions by considering the tangential components of the electric fields and the magnetic fields are continuous. The continuity relations at  $z = 0$  for the system formed by regions I and II are

$$
E_y^{(II)} = \begin{cases} E_y^{(I)} & : -a_0/2 \le x \le a_0/2\\ 0 & : \text{elsewhere} \end{cases} \tag{2.11}
$$

and

$$
H_x^{(I)} = H_x^{(II)}, \quad -a_0/2 \le x \le a_0/2. \tag{2.12}
$$

Applying these conditions to the fields in their relevant regions, we obtain

$$
\begin{bmatrix} \mathbf{B}^{(1)} \\ \mathbf{F}^{(11)} \end{bmatrix} = \begin{bmatrix} \mathbf{S}_{11}^{(0)} & \mathbf{S}_{12}^{(0)} \\ \mathbf{S}_{21}^{(0)} & \mathbf{S}_{22}^{(0)} \end{bmatrix} \begin{bmatrix} \mathbf{F}^{(1)} \\ \mathbf{B}^{(11)} \end{bmatrix}
$$
(2.13)

with

$$
\mathbf{S}_{11}^{(0)} = \left(\mathbf{I} + \mathbf{L}_{\mathbf{H}}^{(0)} \mathbf{L}_{\mathbf{E}}^{(0)}\right)^{-1} \left(\mathbf{I} - \mathbf{L}_{\mathbf{H}}^{(0)} \mathbf{L}_{\mathbf{E}}^{(0)}\right),\tag{2.14}
$$

*Matar et al.; JERR, 22(12): 56-66, 2022; Article no.JERR.90023*

$$
\mathbf{S}_{12}^{(0)} = 2\left(\mathbf{I} + \mathbf{L}_{\mathbf{H}}^{(0)} \mathbf{L}_{\mathbf{E}}^{(0)}\right)^{-1} \mathbf{L}_{\mathbf{H}}^{(0)},\tag{2.15}
$$

$$
S_{21}^{(0)} = 2\left(I + L_{E}^{(0)}L_{H}^{(0)}\right)^{-1}L_{E}^{(0)} = L_{E}^{(0)}\left(I + S_{11}^{(0)}\right)
$$
(2.16)

and

$$
S_{22}^{(0)} = \left(I + L_E^{(0)} L_H^{(0)}\right)^{-1} \left(L_E^{(0)} L_H^{(0)} - I\right) = \left(L_E^{(0)} S_{12}^{(0)} - I\right)
$$
\n(2.17)

Here,  $L_E$  and  $L_H$  stand for the integrals

$$
\left(L_E^{(0)}\right)_{mn} = 2\sqrt{\frac{k_{2m}^{(II)}}{a_0 a_1 k_{2n}^{(I)}}} \int_{-\frac{a_0}{2}}^{\frac{a_0}{2}} \sin\left(\frac{m\pi(x+a_1/2)}{a_1}\right) \times \sin\left(\frac{n\pi(x+a_0/2)}{a_0}\right) dx \tag{2.18}
$$

and

$$
\left(L_H^{(0)}\right)_{mn} = \left(L_E^{(0)}\right)_{nm} \tag{2.19}
$$

while I being the unit matrix. Similarly, for the system formed by the regions II, III and IV, the continuity relations at  $z = L$  are

$$
E_y^{(II)} = \begin{cases} E_y^{(III)} & : a_2/2 \le x \le a_1/2\\ 0 & : -a_2/2 \le x \le a_1/2\\ E_y^{(IV)} & : -a_1/2 \le x \le -a_2/2 \end{cases} \tag{2.20}
$$

$$
H_x^{(III)} = H_x^{(II)}, \ \ a_2/2 \le x \le a_1/2 \tag{2.21}
$$

and

$$
H_x^{(IV)} = H_x^{(II)}, \quad -a_1/2 \le x \le -a_2/2. \tag{2.22}
$$

Substituting the fields in their relevant regions into the above conditions yields

$$
\begin{bmatrix} \mathbf{B}^{(\mathbf{II},\mathbf{L})} \\ \mathbf{F}^{(\mathbf{III})} \\ \mathbf{F}^{(\mathbf{IV})} \end{bmatrix} = \begin{bmatrix} \mathbf{S}_{11}^{(\mathbf{L})} & \mathbf{S}_{12}^{(\mathbf{L})} & \mathbf{S}_{13}^{(\mathbf{L})} \\ \mathbf{S}_{21}^{(\mathbf{L})} & \mathbf{S}_{22}^{(\mathbf{L})} & \mathbf{S}_{23}^{(\mathbf{L})} \\ \mathbf{S}_{31}^{(\mathbf{L})} & \mathbf{S}_{32}^{(\mathbf{L})} & \mathbf{S}_{33}^{(\mathbf{L})} \end{bmatrix} \begin{bmatrix} \mathbf{F}^{(\mathbf{II},\mathbf{L})} \\ \mathbf{B}^{(\mathbf{III})} \\ \mathbf{B}^{(\mathbf{IV})} \end{bmatrix}
$$
(2.23)

where

$$
S_{11}^{(L)} = \left(I + L_{E1}^{(L)} L_{H1}^{(L)} + L_{E2}^{(L)} L_{H2}^{(L)}\right)^{-1} \times \left(L_{E1}^{(L)} L_{H1}^{(L)} + L_{E2}^{(L)} L_{H2}^{(L)} - I\right)
$$
(2.24)

$$
S_{12}^{(L)} = 2\left(I + L_{E1}^{(L)}L_{H1}^{(L)} + L_{E2}^{(L)}L_{H2}^{(L)}\right)^{-1}L_{E1}^{(L)}
$$
(2.25)

$$
\mathbf{S}_{13}^{(L)} = 2\left(\mathbf{I} + \mathbf{L}_{E1}^{(L)}\mathbf{L}_{H1}^{(L)} + \mathbf{L}_{E2}^{(L)}\mathbf{L}_{H2}^{(L)}\right)^{-1}\mathbf{L}_{E2}^{(L)} \tag{2.26}
$$

$$
\mathbf{S}_{21}^{(L)} = \left( \mathbf{L}_{H1}^{(L)} - \mathbf{L}_{H1}^{(L)} \mathbf{S}_{11}^{(L)} \right) \tag{2.27}
$$

$$
S_{22}^{(L)} = \left(I - L_{H1}^{(L)}S_{12}^{(L)}\right)
$$
 (2.28)

$$
S_{23}^{(L)} = -L_{H1}^{(L)}S_{13}^{(L)}
$$
 (2.29)

$$
S_{31}^{(L)} = \left( L_{H2}^{(L)} - L_{H2}^{(L)} S_{11}^{(L)} \right)
$$
 (2.30)

$$
S_{32}^{(L)} = -L_{H2}^{(L)}S_{12}^{(L)}
$$
 (2.31)

and

$$
S_{33}^{(L)} = \left( I - L_{H2}^{(L)} S_{13}^{(L)} \right)
$$
 (2.32)

with

$$
\left(L_{E1}^{(L)}\right)_{mn} = 2 \sqrt{\frac{2k_{zm}^{(II)}}{a_1(a_1 - a_2)k_{zn}^{(III)}}} \int_{\frac{a_2}{2}}^{\frac{a_1}{2}} \sin\left(\frac{m\pi\left(x + \frac{a_1}{2}\right)}{a_1}\right)
$$

$$
\times \sin\left(\frac{n\pi\left(x - \frac{a_2}{2}\right)}{\frac{a_1}{2} - \frac{a_2}{2}}\right) dx = \left(L_{H1}^{(L)}\right)_{nm}
$$
(2.33)

and

$$
\left(L_{E2}^{(L)}\right)_{mn} = 2\sqrt{\frac{2k_{zm}^{(I)}}{a_1(a_1 - a_2)k_{zn}^{(IV)}}} \int_{-\frac{a_1}{2}}^{-\frac{a_2}{2}} \sin\left(\frac{m\pi\left(x + \frac{a_1}{2}\right)}{a_1}\right) \times \sin\left(\frac{n\pi\left(x + \frac{a_1}{2}\right)}{\frac{a_1}{2} - \frac{a_2}{2}}\right) = \left(L_{H2}^{(L)}\right)_{nm}.
$$
\n(2.34)

In order to apply generalized scattering matrix method when cascading this  $3 \times 3$  system to the  $2 \times 2$ system as it is presented in Figure , the relations

$$
\mathbf{F}^{(I,L)} = \mathbf{DF}^{(I)} \tag{2.35}
$$

$$
\mathbf{B}^{(I)} = \mathbf{D}\mathbf{B}^{(I,L)} \tag{2.36}
$$

with

$$
\mathbf{D} = \text{diag}\left\{e^{-jk_{zm}^{(I)}}L\right\} \tag{2.37}
$$

are considered. Finally by the help of Generalized Scattering Matrix Method,

$$
\begin{bmatrix}\n\mathbf{B}^{(I)} \\
\mathbf{F}^{(III)} \\
\mathbf{F}^{(IV)}\n\end{bmatrix} = \begin{bmatrix}\n\mathbf{S}_{11} & \mathbf{S}_{12} & \mathbf{S}_{13} \\
\mathbf{S}_{21} & \mathbf{S}_{22} & \mathbf{S}_{23} \\
\mathbf{S}_{31} & \mathbf{S}_{32} & \mathbf{S}_{33}\n\end{bmatrix} \begin{bmatrix}\n\mathbf{F}^{(I)} \\
\mathbf{B}^{(III)} \\
\mathbf{B}^{(IV)}\n\end{bmatrix}
$$
\n(2.38)

is determined with

$$
S_{11} = S_{11}^{(0)} + S_{12}^{(0)} DUS_{11}^{(L)} DS_{21}^{(0)}
$$
\n(2.39)

$$
S_{12} = S_{12}^{(0)} DUS_{12}^{(L)}
$$
 (2.40)

$$
S_{13} = S_{12}^{(0)} DUS_{13}^{(L)}
$$
 (2.41)

$$
S_{21} = S_{21}^{(L)} DVS_{21}^{(0)} \tag{2.42}
$$

$$
S_{22} = S_{21}^{(L)} DVS_{22}^{(0)} DS_{12}^{(L)} + S_{22}^{(L)}
$$
\n
$$
S_{23} = S_{21}^{(L)} DVS_{22}^{(0)} DS_{12}^{(L)} + S_{22}^{(L)}
$$
\n(2.44)

$$
s_{23} = S_{21}^{(L)} DVS_{22}^{(0)} DS_{13}^{(L)} + S_{23}^{(L)}
$$
(2.44)

$$
S_{31} = S_{31}^{(L)} DV S_{21}^{(0)}
$$
(2.45)  

$$
S_{31} = S_{31}^{(L)} DV S_{31}^{(0)}
$$
(2.46)

$$
S_{32} = S_{31}^{(L)} DVS_{22}^{(0)} DS_{12}^{(L)} + S_{32}^{(L)}
$$
 (2.46)

and

$$
S_{33} = S_{31}^{(L)} DV S_{22}^{(0)} DS_{13}^{(L)} + S_{33}^{(L)}
$$
\n(2.47)

Here the matrices U and V stand for

$$
U = \left(I - S_{11}^{(L)}DS_{22}^{(0)}D\right)^{-1}
$$
 (2.48)

and

$$
V = \left(I - S_{22}^{(0)}DS_{11}^{(L)}D\right)^{-1},
$$
\n(2.49)

respectively. Having formulated one half of the coupler design, it can easily be applied to the other half which allows the full geometry rigorously analyzed by MMT.

**Fig.4. SIW coupler frequency response with MMT and CST.**

# **3 RESULTS AND DISCUSSION**

Fig. 2.3 illustrates the frequency response of the designed SIW coupler when dimensions in Table are used. The usage of RT Duroid 5880 substrate which have low relative permittivity of 2.2 decreases the substrate losses compared with other substrates with higher relative permittivity. Figure 2.3 also shows that the designed coupler has a fractional bandwidth (FBW) of about 16% with respect to 25 GHz as center frequency. FBW is calculated by considering equal amplitude (−3 dB) and 90 degree phase shift of coupled and forwarded output ports, namely port 2 and port 3, respectively. The designed coupler also introduces high isolation between the feeding port (port 1) and port 4 with more than 20 dB. In this design, as the length  $L_4$  increases, the amplitude output at port 3 increases, and the amplitude output at port 2 decreases, so that it can be observed that  $L_4$  with output widths can control the output amplitudes.

The observed discontinuity near 27 GHz in the frequency response emerges due to the appearance of a higher-order mode which is  $TE_{20}$  in the coupler structure . In fabrication process, a matched microstrip-line-to-SIW transaction can be used to feed the designed coupler. Although there are some structure approximations (such as square vias and zero length region), good agreement between MMT and CST is achieved.

The truncation number for MMT analysis is chosen as 45. Higher truncation number means higher accuracy, however for truncation numbers above 25, the differences in the results are negligible.Phase shift of  $90 \pm 5$  degrees is achieved between forward and coupled output ports as can be seen in Figure 2.3, which also presents a good agreement between CST and MMT results. The phase shift property allows this coupler to be a part of beamforming antenna feeding networks. The electrical field distribution at 26 GHz is presented in Figure 2.3. In this Figure, it can be seen that the input signal from port 1 interacts with metallic vias as if they are conductive walls in rectangular waveguides, and is coupled equally to port 2 and port 3 with good isolation on port 4.

**Fig. 6. E-Field distribution of the analyzed coupler**

## **4 CONCLUSION**

Mode-Matching Technique (MMT) analysis with Generalized Scattering Matrix Method (GSMM) of SIW hybrid coupler is presented in this paper. Multi-port cascading approach presented and

discussed to analyze and formulate full coupler scattering matrix. The suggested coupler is analyzed Using MMT Matlab code with 45 as a truncation number and simulated with full-wave solver CST .The designed coupler presents −3 dB equal-amplitude output ports

and more than 20 dB of port isolation with about 90-degree phase shift. Despite some structure approximations in the MMT procedure, good agreement is determined between the S-parameter results obtained by the rigorous analysis with MMT and those from full-wave solver CST.
